

ABSTRACT OF THE DISCLOSURE

The hand-actuated piston plunger includes a vessel member, a drain adapter, a plunger piston, and a piston actuator. Such a plunger may also include any of an actuator or vessel handle or a bellows arrangement within the vessel member. The vessel member 5 has first and second vessel ends and a vessel interior. The adapter is associated with the first vessel end and includes an adapter opening which facilitates fluid flow relative to the vessel interior. The piston is slidably movable within the vessel interior, relative to the actuator. The actuator has first and second ends with the first end operably associated with the piston. The second end of the actuator extends outside of the vessel interior. 10 This actuator can then be used to move the piston within the vessel interior in such a manner so as to selectively either draw fluid into that interior or to expel it therefrom.
